

“Restore London were proactive in restoring a 19th century façade to its former glory, exceeding the standards set by ourselves and the client”.

Andy Sandwith - Surveying & Estimating Director, James Taylor Construction

Scope of Works

Restore London's remit on this façade restoration project was predominantly to carefully salvage and piece together the removed features of this beautiful brick and stone building. Initially Restore London's Management team researched the existing materials & using their in-house library and records found identical matches for both the brick and stone. The retained elements were dry laid and the resultant details transposed onto a working drawing by our Stone Masons, new bricks and stones were measured & ordered as required. Our Structural Engineer then designed and proved fixings and bracketry to ensure the structures were integrated correctly in to the new facades adequately. Our craft team re-built the pediments, Porticos and features in line with the original facades - flawlessly matching new with old. Repairs were undertaken to the rest of the building incorporating stainless steel Heli- bar system.
